

FARM

INCOME

ESTIMATES

for

Missouri Counties

1949 and 1959

This bulletin is a report of Department of Agricultural Economics research project 428, "Trends in the Agricultural and Economic Development of Missouri." The estimates presented were obtained through a procedure developed by Estel H. Hudson and presented in his Ph.D. thesis, "The Development and Evaluation of a Method of Estimating Missouri County Farm Income from Secondary Data" submitted to the Department of Agricultural Economics in August, 1962.

The computational work of Richard Smith and Sandra Dumit is gratefully acknowledged.

FARM INCOME

ESTIMATES

for Missouri Counties

The technological explosion hit farming so hard in the 1950's that it's difficult to realize just what happened, though the effects are well documented. During that time, farm production increased, product prices dropped and costs spiralled upward. As a result, total net farm income in Missouri dropped from an estimated \$594 million in 1949 to \$517 million in 1959. But during the same period the number of farms in Missouri decreased by 70,000, causing the net income per farm to increase from \$2500 to \$3000.

Because of differences in soils, climate, and crop and livestock opportunities, the new technologies of the 1950's did not have an equal impact upon all counties in Missouri. Farm income increased substantially in some counties but remained stable or decreased in others. The purpose of this study was to provide an indication of the relative changes in agricultural development in each county by comparing estimates of farm income in 1949 and 1959.

Income Measures Used

Three measures of farm income have been figured: *realized gross farm income*, *realized net farm income*, and *total net farm income*.

Gross Income

The components of *realized gross farm income* were value of sales of crops and livestock, government payments, home consumption, and rental value of farm dwellings. This estimate represents the market value of all commodities and services originating from farms. The estimates of the market value of sales of crops and livestock were built up commodity by commodity for each crop or livestock item. Value of home consumption and rental value of farm dwellings represent a non-monetary

source of income. If the farm family were to move to town, they would have to rent or purchase a home and buy food supplies.

Realized Net

Realized net farm income is equal to realized gross farm income minus production expenses. Production expenses were estimated item by item for each county. Approximately 35 separate categories of expenses, both variable and fixed, were considered. "Variable" expenses included purchase of feed, seed, fertilizer, livestock, hired labor, cash outlay for operation and repair of buildings, tractors, trucks, automobiles and other machinery, and numerous miscellaneous expenses. "Fixed" or overhead expenses included depreciation of buildings, tractors, automobiles, trucks and other machinery, interest on farm mortgage debt, and farm taxes.

Total Net

Total net farm income was obtained by adding the net change in crop and livestock inventories to realized net farm income. In this way, value of products produced but not sold, or grown in previous years but sold in 1949 or 1959, was taken into consideration.

Total net farm income represents the earnings of the farmer's capital, management, and labor. While interest on borrowed capital was included as an expense, no charge was made for owned capital. Similarly, cash outlays and other costs for hired labor were treated as an expense item while the value of labor provided by operators and their families was not deducted.

Cash and share rents were not deducted as an expense to the operator because the purpose of the study was to estimate income from the farm sector regardless

of whether the recipient was a landlord or operator. Thus, the two measures of income could most accurately be described as the return to the landlord's and the operator's capital equity in the farm business, the return to the operator's management, and the return to operator and family labor.

These figures are closely related to the state estimates published in such federal sources as the United States Department of Agriculture *Farm Income Situation* (FIS) and the Commerce Department's *Survey of Current Business* (series on "Proprietor's Income from Farms" in the August issue each year). National FIS estimates of Missouri gross farm income for 1949 and 1959 were \$1,112 and \$1,269 millions compared to our estimates of \$1,164 and \$1,345 millions. National FIS estimates of Missouri total net farm income were \$498 and \$454 millions compared to estimates in this study of \$594 and \$517 millions.¹ A major difference was that net rent to nonfarm landlords was included in the gross and net farm income reported here, whereas it was excluded by the Departments of Agriculture and Commerce. There was no feasible way to separate this net rent on a county basis. Another difference was a higher valuation of home-consumed items and rental value of farm dwellings in this report. This higher valuation appeared entirely justified.

Income Per Farm

Income per farm was computed by dividing the aggregate figure for a county by the number of farms in the county. For example, total net income per farm was determined by dividing total net income for the county by the number of farms in the county.

¹These state estimates from national sources are used in a recently issued Station Bulletin, *Incomes of Missouri Farmers, 1949-62*.

Income per farm is an average for all farms in the county and is not indicative of the variability of farm income in the county. A county with a low average income per farm may contain a group of extremely profitable farms and the reverse may also be true.

Changes in average income per farm may be associated with a change in total net farm income to the county as a whole or by a change in the number of farms. Estimates were also made of average gross and net incomes for commercial farms. These estimates will be helpful in interpreting farm income variability and levels within counties with many non-commercial farms. The information in Missouri Agricultural Experiment Station Bulletin 787 may be useful for interpreting the income data in this study.

Sources of Data

Data for this study were obtained from many sources, including the United States Census of Agriculture, the State Statistician's Office in Columbia, Mo., and many of the publications of the United States Department of Agriculture. A complete bibliography and description of the method of analysis may be found in "The Development and Evaluation of a Method of Estimating Missouri County Farm Income from Secondary Data," unpublished Ph.D. thesis by Estel H. Hudson, University of Missouri, 1962.

The income and expense figures in this bulletin should be regarded only as approximations of actual incomes and expenses incurred in 1949 and 1959. There are undoubtedly many errors—mostly small—in the data on which the estimates are based.

The use of both 1949 and 1950 dates in this report was due to a peculiarity of that agricultural census. It was taken in April 1950. However, all the data related to income and expenses are for 1949.

Number of Farms

Definition of Commercial Farms

All farms with a minimum of \$1,200 sales in 1949 and \$2,500 in 1959 were classified as commercial farms. In 1949 farms with sales of \$250 to \$1,199 also were classed as commercial if: (1) the operator worked off the farm less than 100 days, and (2) income of farm family from nonfarm sources was less than that from farm sales. In 1959 farms with sales of \$50 to \$2,499 were classed as commercial if the work and nonfarm income provisions of 1949 were met and if the farm operator was under 65 years of age. Therefore, some farm operators 65 or over who had low gross incomes were classified as part-retirement, non-commercial farmers in 1959, whereas they would have classified as commercial farmers in 1949.

The number of commercial farms declined about one-third while the number of non-commercial farms declined by only 5 percent, from 1949 to 1959. There were

sizeable declines in the number of commercial farms in every county. Changes in the number of non-commercial farms varied greatly by counties and 58 counties had increases. Two-thirds of the counties north of the Missouri River had increases contrasted with two-fifths south of the River.

Most farmers receive some income from off-farm sources. Some 63,000 Missouri farm operator families received more income from off-farm sources than net income from their own farms. While the biggest proportion of this income was from off-farm work, there were many other income sources. The group receiving off-farm income increased slightly in Missouri during the decade; changes by counties varied from an increase of 346 in Franklin county to a decline of 607 in Jackson county.

Income data in this report does *not* include off-farm incomes.

State Cash Receipts

Cash receipts rose \$189 million led by gains of \$124 million in cattle and calves, \$47 million in soybeans, and \$43 million in corn. Gains in relative importance (percentage of total cash receipts) were made by cattle and calves, soybeans, corn, and wheat; losses in importance

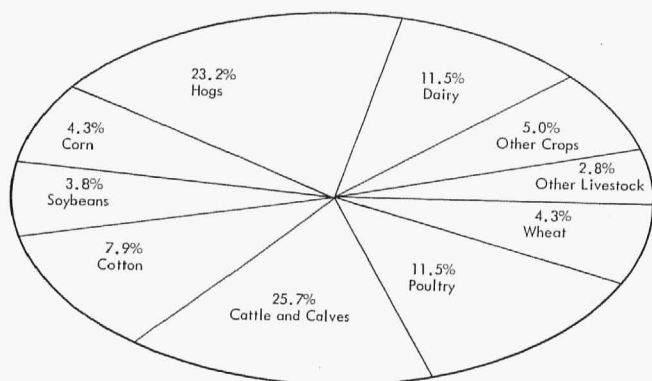

were registered by poultry, hogs, sheep and lambs, and dairy.

Cash receipts are the main component of gross farm income, but other sources contributed \$169 million in 1959.

Farm Production Expenses

Farm production expenses of Missouri farmers rose by \$261 million from 1949 to 1959. This big increase was \$72 million more than the increase in cash receipts. Leading the increase in expenses were increases of \$61 million in depreciation and capital consumption, \$51 million in repair and operation of capital items, and \$50 million in feed purchases.

However, on a percentage basis, the biggest increases were on smaller items: fertilizer 31 percent and interest 134 percent.

The single decline was a \$6 million decline in hired labor.

Total Net Farm Income

Total net farm income is the return to the farm businesses of the county and state after cash and other expenses are deducted and after inventory changes are allowed for. This figure represents the return on the capital equity of the landlord and operator, the return on the operator's management, and the return on operator and family labor.

Gross Farm Income per Farm and per Commercial Farm

Average income per farm is not a very good measure because actual incomes diverge greatly from the average. "Average income per *commercial* farm" is a somewhat better measure of agricultural incomes because it excludes the low farm incomes of non-commercial farms. A precise estimate of commercial farm average income is impossible because most published data are not separable into "commercial" and "non-commercial" portions. To obtain a reasonable indication of commercial farm incomes, the gross cash receipts of a county were divided by the number of commercial farms to give what is labeled "adjusted gross income per commercial farm." The justification of this measure is as follows: Commercial farms market most but not quite all farm products and thus obtain

most cash receipts. It is a bit generous to allocate all cash receipts to the commercial farm section; however, gross income is more than cash receipts because it includes government payments and non-money income (food and shelter provided to the farm family). Therefore, the over-generous estimate of cash receipts per commercial farm is offset approximately by the omission of other sources of gross farm income.

In counties with relatively few non-commercial farms, such as Atchison and Pemiscot, the two income averages are much the same. On the other hand, in counties such as Boone or Taney, with many non-commercial farms, the adjusted average income per commercial farm greatly exceeds the average income for all farms.

* Rounded to nearest hundred dollars.

Growth in Gross Farm Income per Farm and per Commercial Farm

Gross incomes per farm and per commercial farm increased in every county in Missouri between 1949 and 1959. Statewide, gross incomes for *all* farms rose \$2,900 while gross income per *commercial* farm rose \$5,000. Since most, if not all, of the increase in gross sales and income occurred in the commercial sector, the \$5,000 increase per commercial farm is much the better indicator of actual

changes in agriculture.

Sizes of increases in gross income per commercial farm varied greatly from county to county. Counties with increases of more than \$10,000 per commercial farm included Atchison (\$11,100), Clay (\$10,100), Mississippi (\$11,500), New Madrid (\$10,600), and Pemiscot (\$13,100).

Net Income per Farm

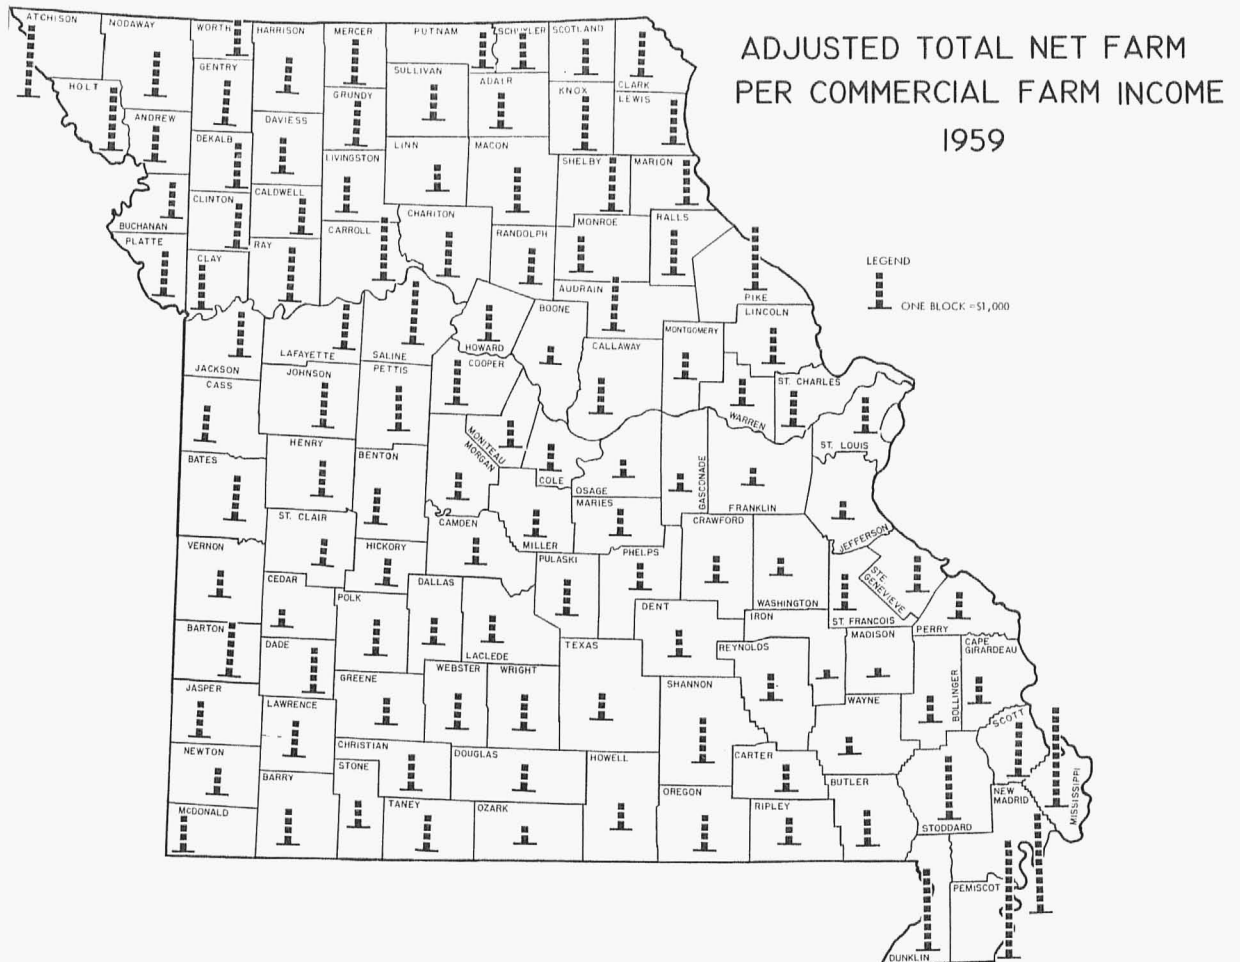

Average net farm income per *commercial* farm may be expected to exceed average income per farm in any county such as Barry or Carter with a high proportion of non-commercial farms.

Adjusted net total farm income per commercial farm was approximated by subtracting from the county total net, an assumed net income of \$500 per each non-commercial farm. The remaining county net income was then divided by the number of commercial farms. Available data supports an assumption that non-commercial net farm incomes are \$500 or less.

Note that every one of the top ten counties borders the Missouri or Mississippi River, except Stoddard and Dunklin which are Delta counties.

Changes in Net Income per Farm

While net farm income per farm and per commercial farm increased for the state from 1949 to 59, there were great differences among counties and 28 counties had declines in net per commercial farm. Of these 28 counties, 26 had declines in total net farm income for the county of 30 percent or more. Some of the differences were due to relative emphasis upon particular crops and types of livestock in the county. Beef cattle and cotton prices were about three cents a pound higher in 1959 than in 1949 while hog prices were four cents lower and the price index for poultry and eggs fell 35 percent. Other prices were mostly unchanged but the big expansion in soybean acreage greatly increased that source of income.

Of the 28 counties with declines in net income per commercial farm, 20 had 75% or more of their cash receipts from livestock, in contrast with a state average of 67.5 percent from livestock.

Other differences may be partially due to errors of data. In the following counties, increases in production expense in relation to changes in gross income were much higher than the state average: Boone, Cape Girardeau, Maries, Madison, Montgomery, Osage, and Perry.

In general, the figures are accurate enough to identify the counties with large or small gains or declines in net income. The large gains were in the cash-grain river counties. The large losses in net income per commercial farm (over \$1,000) were in Boone, Madison and Perry counties. Cost-of-production increases appeared much out of line in all three counties.

Counties with increases of \$3,000 or more in adjusted total net farm income per commercial farm included Atchison (\$3,400), Barton (\$3,400), Dunklin (\$4,400), Mississippi (\$6,100), New Madrid (\$6,500), Pemiscot (\$8,500), and Stoddard (\$3,600).

THE 41 COUNTIES WITH INCREASES EXCEEDING THE STATE AVERAGE INCREASE OF \$1,146
